

HEALTH CARE MANAGEMENT

ABSTRACT

Health Care Management is the maintenance or improvement of health via the prevention, diagnosis, treatment of disease, illness, injury and other physical and mental impairments in human beings. Access to health care may vary across countries, groups, and individuals, largely influenced by social and economic conditions as well as the health policies in place. In the present system, Countries and jurisdictions have different policies and plans in relation to the personal and population-based health care goals within their societies. In some cases patients go to other doctors for second opinion, and then they have to carry their reports and prescriptions. There is a chance of losing some important reports. Bills also should be maintained at tests.

Health Care Management System is privileged that patient should not carry their records to hospitals and doctors should not ask patient details on every visit. In order to implement this we use **BLOCK CHAIN TECHNOLOGY**. In this way we can access patients reports anywhere round the world at any time.
